IN THE CLAIMS

Please cancel claims 1-12 without prejudice.

13. (Amended) A nursing bottle adapted to be filled with liquid, wherein the bottle prevents a vacuum from being formed within the bottle when inverted, the nursing bottle comprising:
a container having an open top and being adapted to contain a quantity of liquid;

a vent unit adapted to fit within the container comprising a reservoir tube having an upper and lower portion, the reservoir tube having a proximal first end adapted to fit adjacent the top of the container and an open second end projecting sufficiently downwardly in the container so that when the bottle is inverted the open second end is above the level of the liquid in the container; and

an airway in the vent unit extending between the outside of the container and a point in the reservoir tube above the level of the liquid trapped in the reservoir tube when the nursing bottle is inverted.

14. (Amended) The nursing bottle according to claim 13 wherein the vent unit includes a vent tube, in communication with the airway, having a distal end, the vent tube projecting into the reservoir tube sufficiently so the distal end of the vent tube is above the level of liquid trapped in the reservoir tube when the bottle is inverted.

15. (Amended) The nursing bottle according to claim 13 wherein the vent unit further comprises an insert which secures to the reservoir tube, the vent unit adjacent to the reservoir

a1 Cond B'
 conce tube preventing liquid from entering the airway and allowing air
 to flow through the airway.

Sub B² 19. (Amended) A container which vents the container to the
 atmosphere to resist the formation of a vacuum when the container
 is inverted to dispense a liquid therefrom, the container
 comprising: a receptacle adapted to hold liquid, a liquid outlet
 for dispensing the liquid when the container is inverted, a vent
 unit adapted to fit within the receptacle comprising a reservoir
 tube having upper and lower portions, the reservoir tube having a
 proximal first end adjacent the top of the receptacle and an open
 second end projecting sufficiently downwardly into the receptacle
 [;] so that when the container is inverted the open second end is
 above the level of the liquid in the receptacle, an airway in the
 vent unit extending between the outside of the receptacle and a
 point in the reservoir tube above the level of liquid trapped in
 the reservoir tube when the container is inverted, and a vent
 tube adapted to fit within the reservoir tube, having a distal
 end, the vent tube projecting into the reservoir tube
 sufficiently so the distal end of the vent tube is above the
 level of liquid trapped in the reservoir tube when the bottle is
 inverted.

Sub B³ 21. (Amended) A vent unit adapted to install in the open
 top of a container to vent the container to the atmosphere to
 resist the formation of a vacuum when the container is inverted
 to dispense liquid, the vent unit comprising: a reservoir tube
 having a proximal first end and an open second end, wherein the
 first end is adjacent the open top of the container, the second
 end of the reservoir tube projecting sufficiently downwardly in
 the container so that when the container is inverted the second
 end is above the liquid in the inverted container, the vent unit
 having an airway extending from the exterior of the container to
 a point in the reservoir tube above the level of the liquid
 trapped inside the reservoir tube when the container is inverted,
 and a vent tube adapted to fit within the reservoir tube, having
 a distal end, the vent tube projecting into the reservoir tube
